The diagram illustrates a signal processing system for a mobile communication system, enclosed in a dashed box labeled  $IC_{1k}'$ . The system components and their interconnections are as follows:

- Inputs:**  $X_{1k}(t)$  and  $X_{1(k+1)}(t)$  enter the system from the left.
- INVERSE SPREADER:** Receives  $X_{1k}(t)$  and outputs  $IS_{1k}$ .
- ADAPTIVE ARRAY:** Receives  $IS_{1k}$  and outputs  $AA_{1k}$  and  $ED_{1k}$ .
- ERROR DETERMINING UNIT:** Receives  $ED_{1k}$  and outputs  $E_{1k}$ .
- DEMODULATOR:** Receives  $Y_{1k}(t)$  and outputs  $DM_{1k}$ .
- RE-MODULATOR:** Receives  $DM_{1k}$  and outputs  $RM_{1k}$ .
- PARAMETER ESTIMATOR:** Receives  $PE_{1k}$  and outputs  $H_{1k}Y_{1k}(t)$ .
- SPREADER:** Receives  $S_{1k}$  and outputs  $AD_{1k}$ .
- AND gate (AND1k):** Receives  $AD_{1k}$  and  $H_{1k}Y_{1k}(t)$  and outputs  $MP_{1k}$ .
- Output:**  $Y_{1k}(t)$  is the final output of the system.

The diagram also shows a feedback loop where  $Y_{1k}(t)$  is fed back to the INVERSE SPREADER and the PARAMETER ESTIMATOR. The signal  $Y_{1k}(t)$  is also fed back to the RE-MODULATOR. The signal  $E_{1k}$  is fed back to the ERROR DETERMINING UNIT. The signal  $AD_{1k}$  is fed back to the AND gate. The signal  $MP_{1k}$  is fed back to the AND gate. The signal  $IC_{1k}'$  is the output of the system.
